

Technical requirements Guestbook

In order to get an idea of your development skills, please implement a web-based guestbook. It should be written in ASP.NET in C#. For persistent data storage, please use XML-Files, Text-Files or SQL Server database, using standard .net data access methods.

Description

The guestbook is web-based, and lists entered comments by users. Also, it lets users add a guestbook entry, and edit their own guestbook entries when coming back later (optional). Paging the guestbook (showing only 10 entries per page) is optional, but should be.

Architecture

Please use object orientation and create a separate control for a single guestbook entry and one designated class to hold a guestbook entry.

Documentation

Please document by commenting in the code. Also, if certain installation steps are required, include an installation text file. Send either source code and required files for the web, or a compilable Visual Studio project/solution
