

- Produce PDF files without having Acrobat (Implementation of new version)!

PDFproducer v1.1

PDFproducer produces PDF file of any text file. Still no graphics support. The really thing I want to show are the basic elements of a PDF file. I have always wanted to do this. The PDF files (generated by this program) are tested on Acrobat 5.0, Try changing 1.2 (version) in header to 0.9 or below may it works on Acrobat 4.0 also. You can modify its contents, but if you make a major change please inform me. Please spare some time to vote me. If any bugs are found, please inform me. If you have a PDF specifications/format file please tell me. New : Implemented whole of the new version made by Aldos. Credits to Aldos because he made word wrapping font_size, font_face change support possible. He also made better GUI & other improvements.
